

# Introduction to Microcomputers

## Lab2

The goal of this lab is to use the comparison instructions of PIC16F877A to implement some if statements.

### Assignment

Consider the following division of the 2D plane based on the values of x and y variables:

Given x and y values, we would like to know which box we are in. We can do that using a C code as given below:

```
int8_t x = 5;
int8_t y = 6;
uint8_t box;

if (x < 0 || x > 11 || y < 0 || y > 10) box = -1; // We do not fall inside a valid box
else if (x <= 3){
    if (y <= 1)    box = 3;
    else if (y <= 4) box = 2;
    else          box = 1;
} else if (x <= 7){
    if (y <= 5) box=5;
    else      box=4;
} else {
    if (y<=2)    box=9;
    else if (y<=6) box=8;
    else if (y<=8) box=7;
    else        box=6;
} //end-else

PORTD = box; // Display the box number on the LEDs
```

In this lab you are asked to implement the above logic in PIC assembly code. Test your code thoroughly to make sure that it works for all cases. The TAs will test your code with some random x and y values. Your code must work correctly for you to get the full grade. **No partial credit will be given.**
